3. Methodology
4. Results & Discussion:
 - (i) Flood Alleviation
 - (ii) Drought Control
 - (iii) Reduction of Urban Heat Island
5. Conclusion

1. Introduction to Climate Change (Global)

Asia Tenggara rugi RM39 bilion akibat fenomena El Nino

Sektor ekonomi dan pertanian ditimpa bencana terburuk dalam sejarah

KEMARAU berpanjangan dan cuaca panas akibat fenomena El Nino menyebabkan sektor ekonomi di Asia Tenggara mengalami kerugian mencapai AS\$12 bilion (RM59.1 bilion), menurut pertubuhan ekonomi IHS Global Insight.

Fenomena cuaca itu bukan sahaja mencetuskan masalah kekurangan air dan makanan malah memusnahkan banyak tanaman di seluruh Asia. Ia turut menimbulkan masalah bekalan makanan di Filipina ketika banyak kawasan di Asia Tenggara merekodkan suhu mencecah 40 darjah Celsius.

Setiasaaha Agung Hal Ehwal Kemasyarakatan Pertubuhan Bangsa-Bangsa Bersatu, Stephen O'Brien berkata, situasi dijangka semakin buruk apabila fenomena La Nina yang membawa hujan lebat serta mengakibatkan kerosakan setara dengan El Nino diramal berlaku pada akhir tahun ini.

Fenomena La Nina akan membawa hujan lebat di kawasan sering dilanda banjir serta menyebabkan tanaman musnah terdapat kepada pernyok dan kemusnahkan. - AFP

LAPORAN DI MUKA 2

CLIMATE CHANGE IS REAL & HAPPENING NOW!!!

**CLIMATE CHANGE IS NO LONGER
SOMETHING IN THE DISTANT FUTURE. IT IS
UPON US NOW & THERE IS NO ESCAPE.**

WARNINGS FROM THE NOT TOO DISTANT PAST

I want to testify today about what I believe is a **planetary emergency - a crisis that threatens the survival of our civilization** and the habitability of the Earth.

Al Gore

Testifying on impact of global warming before US congress.

Jan 27, 2009

WARNINGS FROM THE NOT TOO DISTANT PAST

The danger posed by war to all of humanity - and to our planet - is at least matched by the climate crisis and global warming. I believe that the world has reached a critical stage in its efforts to exercise responsible environmental stewardship. **UN Secretary General Ban Ki-moon** (Mar 1, 2007)

WARNINGS FROM THE CLIMATE SYSTEM

Warming of the climate system

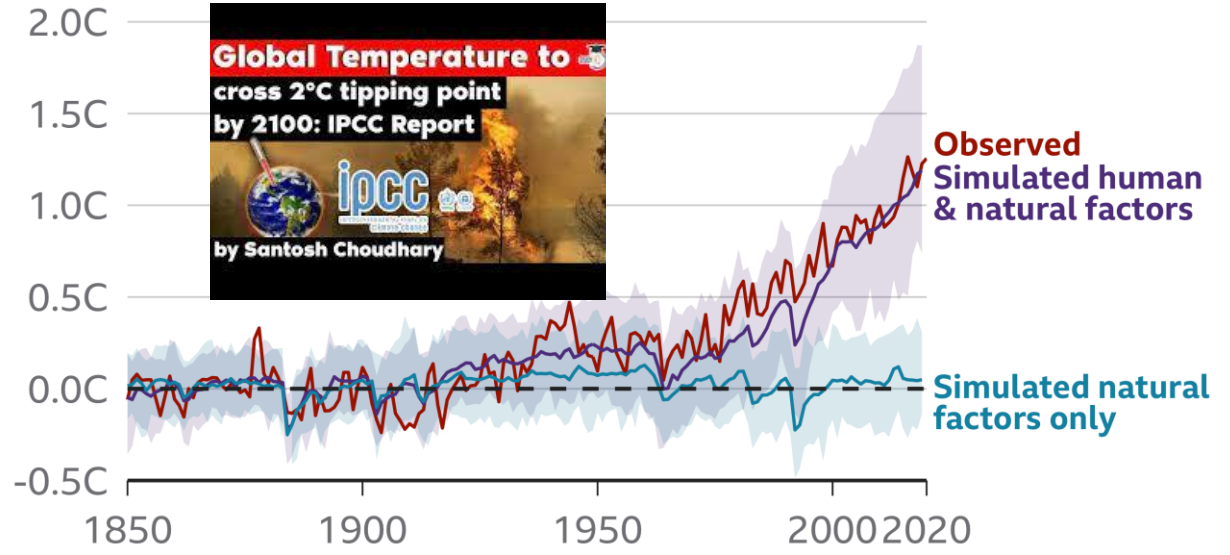

Increasing in global average air and ocean temperatures

Rising global average sea level

Reductions of snow and ice

Human influence has warmed the climate

Change in average global temperature relative to 1850-1900, showing observed temperatures and computer simulations

Note: Shaded areas show possible range for simulated scenarios

Source: IPCC, 2021: Summary for Policymakers

2021 ties 2018 for Sixth Warmest Year on Record

2. Observed Trend of Climate Change & Climate Variability over Malaysia

2.1 Long Term Climate Change Over Malaysia

Both Observed & Modelled (Projected) temperatures are increasing.

- 31 out of 36 Meteorological Stations recorded highest maximum temperature during 1990s and after
- Maximum temp. increased: 0.7 – 1.1°C
- Mean temp. increased: 0.6 – 1.2°C
- Minimum temp. increased: 1.1 – 2.0°C per half century

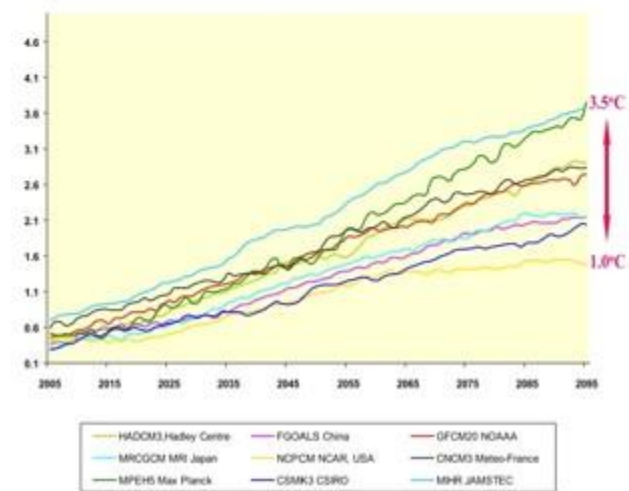

Projected Temperature Changes Relative to the Baseline (1961-1990) for Peninsular Malaysia from Nine GCMs, Based on SRES A1B

Projected Temperature Changes Relative to the Baseline (1961-1990) for Sabah from Nine GCMs, Based on SRES A1B

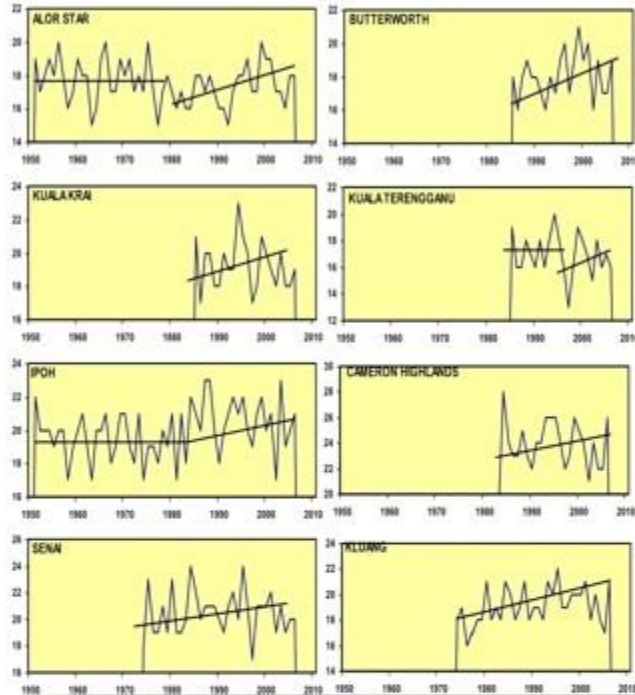

Projected Temperature Changes Relative to the Baseline (1961-1990) for Sarawak from Nine GCMs, Based on SRES A1B

Legend for Peninsular Malaysia: HADCM3 Hadley Centre, FGOALS China, GFCM2.5 NOAA, MRI-CGCM MRJ Japan, NCCPM NCAR USA, CNRM3 Meteo-France, MPI-ECH Max Planck, CSIRO CSIRO, MIROC3.2 JAMSTEC

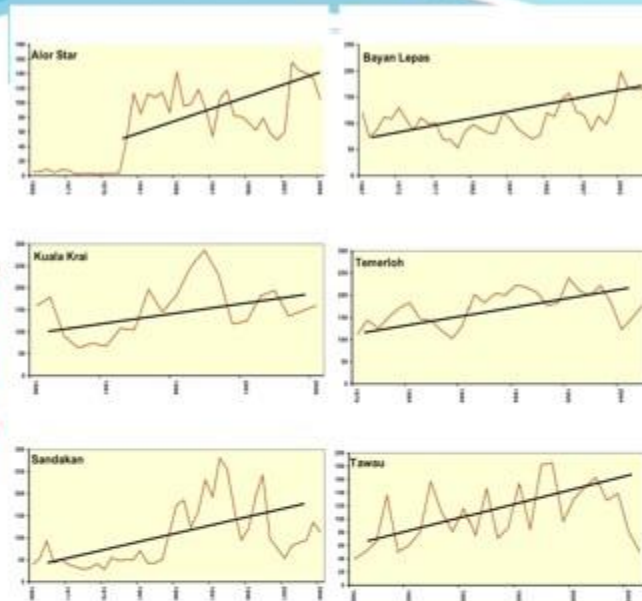

Legend for Sabah: HADCM3 Hadley Centre, FGOALS China, GFCM2.5 NOAA, MRI-CGCM MRJ Japan, NCCPM NCAR USA, CNRM3 Meteo-France, MPI-ECH Max Planck, CSIRO CSIRO, MIROC3.2 JAMSTEC

Legend for Sarawak: HADCM3 Hadley Centre, FGOALS China, GFCM2.5 NOAA, MRI-CGCM MRJ Japan, NCCPM NCAR USA, CNRM3 Meteo-France, MPI-ECH Max Planck, CSIRO CSIRO, MIROC3.2 JAMSTEC

Historical Data From MMD's Stations

Since ~1980s: Increasing number of days of extreme rainfall event (exceeding 90th percentile of total rainfall) for several stations over the Peninsular Malaysia

Increasing number of days of extreme wind events (exceeding 90th percentile of the most frequent wind speed in a year) in some parts of Malaysia

November 05, 2017

At Least 3 Dead in Malaysia as Severe Storm Forces Thousands to Evacuate

An aerial view shows flooded George Town in Penang, Malaysia, on Nov. 5, 2017. A northern typhoon-like storm has been estimated to a severe storm that led to at least three deaths and forced roughly 2,000 people from their homes in the world's leading of year's typhoon sea.

August 10, 2019

Malaysia lashed by storm, causing havoc in Penang, Kedah, Perlis

Storms in Penang in the past year have caused havoc in the region with the region being the first to be hit by a typhoon-like storm.

AVERAGE NUMBER OF THUNDERSTORM DAYS

OVERALL MALAYSIAN SCENARIO

- Observed increase in **minimum, mean & maximum** surface temperature trend for Malaysia,
- **Larger increase** in **minimum** surface temperature compared to mean & maximum surface temperature. Highest increase of minimum temperature at a rate of 2.0°C/50-yr for Sabah, 1.5°C/50-yr for Pen. Malaysia and 1.1°C/50-yr for Sarawak.
- Overall, no evident of increase or decrease has been observed for rainfall in Malaysia, but:
 - increase number of days of **extreme** rainfall events
 - increase number of days of **extreme** wind events
 - increase in number of thunderstorm days

Annual Mean Temperature Anomaly Relative to 1990 - 1999

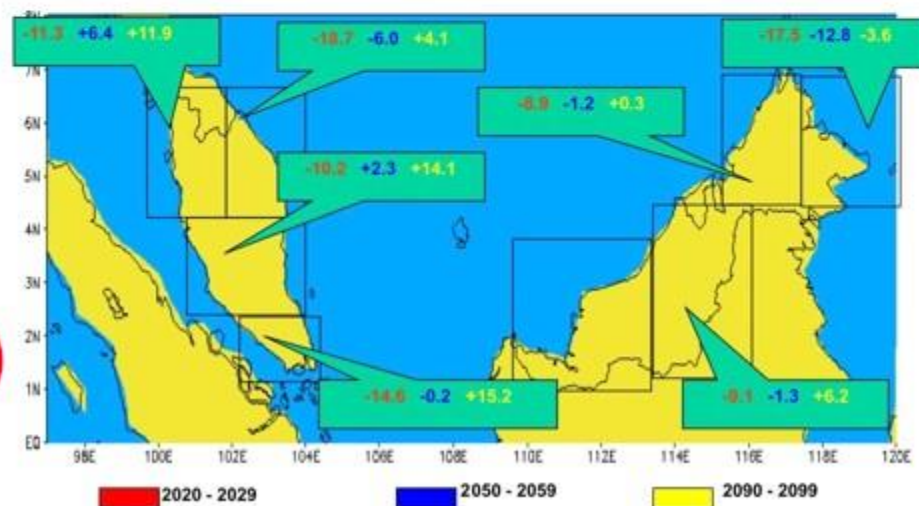

Implications (3 Things we need to

Adapt to):

1. It's getting hotter and hotter (Heat Waves)
2. It's getting drier between 2020-2029 – Droughts & Water Crises)
3. Increase in Storms & Extreme Rainfall (Floods).

Annual Mean Rainfall Anomaly (%) Relative to 1990 - 1999

Severe heatwave grips Malaysia

Intense spell of hot and dry weather brought on by El Nino hits food and water supplies across parts of SE Asia.

HEAT WAVE

A period of extraordinary high temperatures, exceeding the maximum daily average, with the hot weather condition persisting for several days or weeks.

In Malaysia, heat waves is defined when daily maximum temperature exceeds 37°C for three consecutive days

HEAT STROKE

SYMPTOMS

- Dizziness, nausea
- Low blood pressure
- Short breath
- Feeling uncomfortable, confused & may become unconscious
- Fast heartbeat
- Sudden increase in body temperature (41 °C)
- Convulsion or fainting

Prevention

- Avoid any physical activity when you feel fatigued, very hungry or thirsty under prolonged sun exposure
- Drink 3-4 litres of water per day
- Practise healthy eating habits & have a balanced diet

Land-use Change in Kuala Lumpur

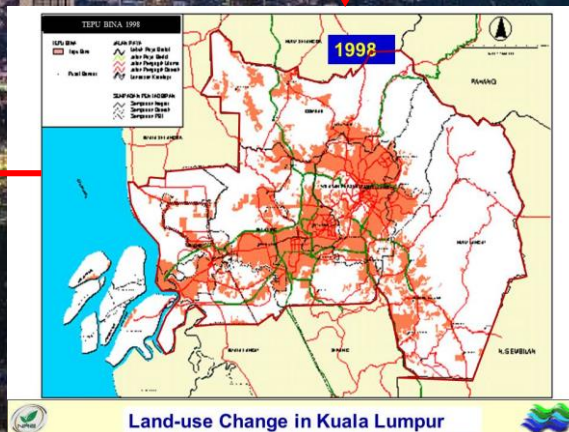

Land-use Change in Kuala Lumpur

MAIN CAUSES OF FLOODS

Loss of Forests & Green Areas which absorb Rainfall is one of the main reasons for the occurrence of flash floods

Effect of Urbanisation on Storm Runoff

Increase In Development Area
0 - 40 %

Runoff Quantity
Q → Increase 190 %

Velocity
V → Increase 2x

Tc → 50 % decrease

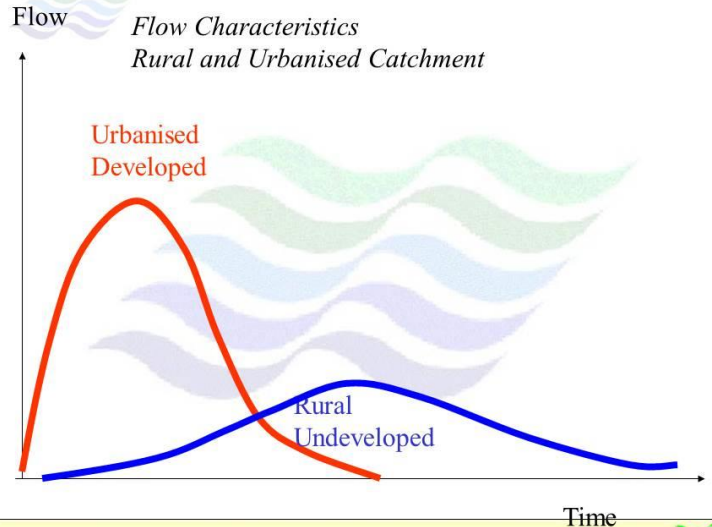

LAND USE CHANGE FROM FOREST TO URBAN EXACERBATES FLASH FLOODS

natural journey into the river. Only a portion of the original rainfall ends up in the river because a significant part is absorbed by vegetation and soil. Dense tropical vegetation acts as a 'sponge' which soaks up much of the rain, which means floods are unlikely.

URBAN AREAS HAVE NO FORESTS TO ABSORB PART OF THE RAIN & SURFACES ARE IMPERVIOUS – INCREASING RUNOFF & SHORTENING LAG TIME

TYPICAL URBAN/CITY AREAS EXPERIENCE FREQUENT FLOODS OF GREATER MAGNITUDES. FLASH FLOODS WITH FAST RISING PEAK FLOWS & LAST ONLY A FEW HOURS ARE MOST COMMON IN CITIES

RM40bil needed to check floods

By REGINA LEE
regina@thestar.com.my

Uggah: Funds and mitigation projects lacking

PETALING JAYA: A staggering RM40bil is needed to remedy all the flood problems in the country, said Natural Resources and Environment Minister Datuk Seri Douglas Uggah Embas.

However, the Government was still short in flood mitigation projects with only RM2.4bil allocated so far

"So, we have to be creative and innovative when dealing with floods," he told reporters after opening a seminar on "Climate Change: Adaptation or Mitigation, Do We Have a Choice?" organised by Centre for Environment, Technology and Development, Malaysia (Cetdem) here yesterday.

supposed to cover the 29,000 sq km flood prone areas throughout Malaysia. That size, which is based on a 2003 study, is only slightly smaller than the total land mass of Kedah and Perak put together.

"But in 2006, 2007 and even last year, we found new areas which flooded easily as the sea level rises every year," he said.

Despite that, Uggah was upbeat about receiving a fair allocation in dealing with floods.

In the second rolling plan, projects have been implemented in parts of Johor, Perak, Kedah, Kelantan, Perlis, Terengganu and Penang.

Parts of Selangor have been identified for flood mitigation projects in the next phase.

Cetdem chairman Gurmit Singh said not all floods were caused by climate change.

"Sometimes the floods are caused by non-functioning drainage system," he said.

On another matter, Uggah said Malaysia was well on the way to achieving a 40% reduction of carbon emissions by 2020 as pledged by Prime Minister Datuk Seri Najib Tun Razak at the 15th Conference of Parties in Copenhagen in 2009.

cost is

SEVERE FLOOD LOSSES!

- Low blood pressure
- Short breath
- Feeling uncomfortable, confused & may become unconscious
- Fast heartbeat
- Sudden increase in body temperature (41°C)
- Convulsion or fainting

Prevention

- Avoid any physical activity when you feel fatigued, very hungry or thirsty under prolonged sun exposure
- Drink 3-4 litres of water per day
- Practice healthy eating habits & have a balanced diet

Expect Klang Valley Heat Wave to Linger Until June

By Patricia Emmanuel
Posted on March 21, 2016

The Pahang River runs dry and schools remain closed due to the heatwave in Temerloh, [AFP]

CAUSES OF URBAN HEAT ISLAND

- CONCRETE JUNGLE
- DARK ABSORBANT SURFACES
- LACK OF VEGETATION
- LOW RATES OF EVAPOTRANSPIRATION
- HIGH HEAT SOURCE POTENTIAL
- CENTRE OF AIR POLLUTION
- CONCENTRATION OF INDUSTRIES
- HIGH CONCENTRATION OF POPULATION
- ROUGH SURFACES
- HIGH CONCENTRATION OF POPULATION

Ho Chi Minh City

Kuala Lumpur

Osaka

CONCRETE JUNGLE, DARK ABSORBENT SURFACES & NO VEGETATION/TREES:

- Low Rates of Albedo
- High Rates of Solar Radiation Absorption
- Little Evapotranspiration to Disperse Heat Upwards

Big Ben, London Mac 2006

LOW RATES OF EVAPOTRANSPIRATION

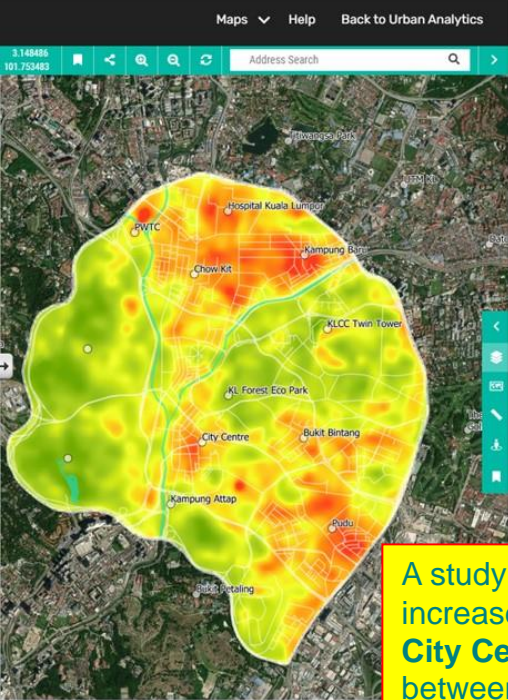

•EVAPOTRANSPIRATION (Evaporation + Perspiration) is a process of Heat Dispersion that Cools the City as it Conveys Heat Upwards

GENERATION OF ANTHROPOGENIC HEAT

- Heating of Buildings in Winter
- Cooling Via Air-Conditioners in Summer
- Motorise Vehicles Generate a Lot of Heat. Traffic Jams with Thousands of Vehicles produce Urban Heat Islands
- Industries generate a lot of heat (e.g. Steel plants, Power plants, Petroleum Processing plants, etc)
- Cooking generates a lot of heat (Ovens, Gas Stoves Charcoal etc)
- Lighting generates heat
- Burning of Rubbish in Landfills
- Other Human Activities - Barbecue, Green House, Washing Machines, Refrigerators, Computers, etc.

KLCC: Land Surface Temperature (1989 & 2019)

"The presence of green spaces can enhance the health and well-being of people living and working in cities." (Leeds Ecosystem, Atmosphere and Forest (LEAF) Centre, 2015)

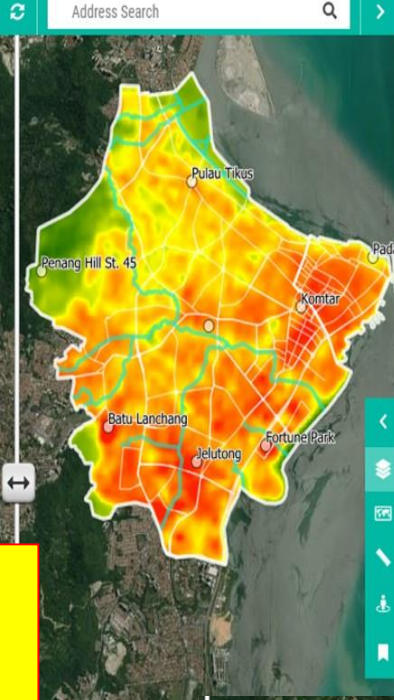

Slide right for 1989, left for 2019

In December 1989, the highest recorded surface temperature in Kuala Lumpur city center was 29.40°C while the lowest 21.07°C. In said year, not much development can be seen in areas of Mahameru and Jalan Puncak (KL Forest Eco Park), identifying them as the least warm at the time. However, hottest spots included the City Centre, Bukit Bintang, Pudu and North KL (Chow Kit, Kampung Baru) - localities heavily concentrated with human activities and local economies. Distinguishable brownfields observed around Jalan Ampang (now KLCC) which would eventually house many commercial and business areas also contributed to the high temperature. However, places that recorded temperatures over 29°C were Sungai Wang Plaza in Bukit Bintang and areas surrounding Jalan Pudu.

After three decades, in October 2019, the highest and lowest recorded temperatures were 31.04°C and 23.34°C, respectively. This signals a **increase of 1.64°C** between both years' hottest surface temperature*. Petronas Towers complex in 2005 is considered as the centrepiece and catalyst for KL's present modernism and has substantially increased the market values of commercial properties in the city. It is apparent from latest satellite data there has been distinguishable **increase in the city's built environment**.

Contrarily, there were few locations that have either decreased or steadied in temperature in 2019. Based on satellite data and 2019's LST map, park reserve areas such as KL Forest Eco Park and Taman Botani Perdana, and public spaces and gardens in Mahameru and KLCC were observed as the least warm in the city.

A study by Think City showed an increase of 1.64° C in Kuala Lumpur City Centre's surface temperature between 1989 and 2019.

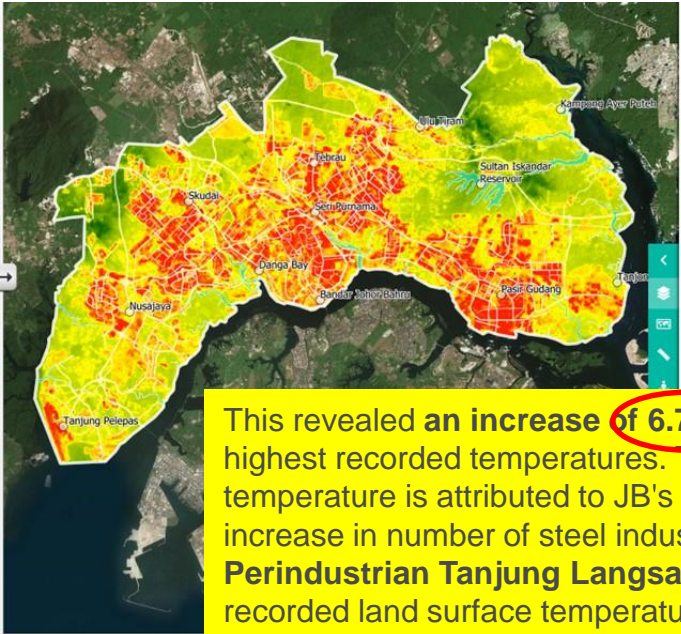

"It is essential to incorporate remotely-sensed data in the study of urban climate to attain the syntopic view required in understanding the interaction between the natural and man-made processes." (Stefanov & Brazel, 2007)

Slide right for 1988, left for 2020

In February 1988, the highest recorded surface temperature in George Town was 28.36°C while the lowest 21.07°C. LST was particularly high in areas of **Kompleks Tun Abdul Razak (KOMTAR)** (completed two years prior) and **Jalan Dato' Keramat**. In 1988, the hottest location over 28°C was a former tin smelting plant (now Penang Times Square) in Jalan Dato' Keramat.

After over three decades, surface temperatures rose significantly. In February 2020, the highest and lowest recorded temperatures were 34.73°C and 24.30°C, respectively - an **increase of 6.4°C** between both years' peak records. The rise occurred across all of George Town, including areas of Penang Hill in the west. Locations reaching maximum temperature over 34°C are located in **Batu Lanchang, Jelutong, Fortune Park Industry, KOMTAR and the George Town World Heritage Site (GTWHS)**.

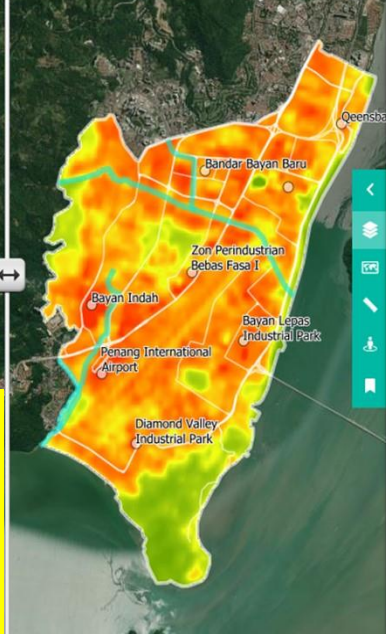

"and man-made processes." (Stefanov & Brazel, 2007)

Slide right for 2005, left for 2018

In May 2005, the highest recorded surface temperature in Johor Bahru (JB) district was 27.94°C while the lowest 17.93°C. In said year, north of JB especially north and west of Tebrau were still greenfields - depicting them as two of the least warm areas at the time. However, hottest areas reaching over 25°C were **Skudai, Seri Purnama, Bandar Johor Bahru and Pasir Gudang**. Seri Purnama and Pasir Gudang are in fact confluences for many heavy industries of transportation and logistics, petrochemicals, electronics, plastics and many more. Meanwhile, Skudai and Bandar Johor Bahru are where many human activities and businesses concentrate.

In 2005, the east of JB (along Kampong Ayer Puteh) recorded surface temperatures between 19°C and 25°C - uncharacteristic for the forest landscapes surrounding the deltas of Sungai Johor at the time. Vegetation index data shows in 2005, these landscapes had indeed been cleared away, indicating **deforestation activities**. This explains the high LST range in these massive patches of land (approximately up to 40 km²). However, after 13 years in 2018, the temperatures of these areas dropped by a maximum of 2°C. Close inspection on crowns of

This revealed an increase of 6.7° C between 2005 to 2018's highest recorded temperatures. This substantial rise in temperature is attributed to JB's rate of gentrification and increase in number of steel industries, particularly in **Kawasan Perindustrian Tanjung Langsat and Pasir Gudang** which recorded land surface temperatures over 33° C.

Slide right for 1988, left for 2020

In February 1988, the maximum surface temperature recorded while the minimum 21.51°C. Bayan Lepas' landscape was 4 km land reclamation activities post 2008 (the dotted white line in land). In 1988, many areas of Bayan Lepas had been **clear industries and residences**. **Penang International Airport** and e of Bayan Lepas recorded temperatures in the higher range (over 34°C) with high level of human activities and thermal radiation emitted.

After 32 years, surface temperature rose by **5.63°C**. In February 2020, recorded temperatures were 34.41°C and 21.98°C, respectively. This temperature is the consequence of **increased industries and industrial areas** (e.g. **BL Free Industrial Zones, Diamond Valley** areas (e.g. **Bandar Bayan Baru, Bayan Indah**) and commercial **Penang International Airport**) have recorded surface temperatures over 33°C). The least warm area pointed to an unoccupied and non-controlled and suppressed if given the opportunity.

How Green & Blue Surfaces (RWH Ponds) help reduce UHIs

They will reduce
Most of the Causes
of UHIs in cities

- **REDUCE CONCRETE JUNGLE**
- **REDUCE DARK ABSORBANT SURFACES**
- **INCREASE VEGETATION COVER (ESPECIALLY TREES)**
- **INCREASE RATES OF EVAPOTRANSPIRATION**
- **LOWER HEAT SOURCE POTENTIAL**
- **REDUCE AIR POLLUTION**
- **REPLACE INDUSTRIES**
- **REDUCE CONCENTRATION OF BUILDINGS**
- **INCREASE GREEN-BLUE SURFACES**
- **REDUCE CONCENTRATION OF AUTOMOBILES**

ROLE OF PONDS & TREES IN INCREASING EVAPO-TRANSPIRATION INCREASE HEAT TRANSFER FROM SURFACE (BIOSPHERE & HYDROSPHERE) UPWARDS INTO THE ATMOSPHERE

- 1 gram of water evaporated/transpired
= 600 Calories of Heat

Figure 5: Impervious Surfaces and Reduced Evapotranspiration

Highly developed urban areas (right), which are characterized by 75%-100% impervious surfaces, have less surface moisture available for evapotranspiration than natural ground cover, which has less than 10% impervious cover (left). This characteristic contributes to higher surface and air temperatures in urban areas.

GREEN SURFACES & PONDS REDUCES HEAT

USM'S HARAPAN LAKE

OSD Landscape Tank in public area.

WITHOUT TREES

WITH TREES

Trees and vegetation lower surface and air temperatures by providing (i) shade and (ii) evapotranspiration.

Shaded surfaces, for example, may be 11–25° C cooler than the peak temperatures of unshaded materials (Akbari, H., D. Kurn, et al. 1997)

Evapotranspiration, alone or in combination with shading, can help reduce peak summer temperatures by 1–5° C (Huang, et al. 1990; Kurn, et al, 1994).

Infra-red thermal image of heat being emitted in Tokyo. Concrete buildings & roads due to their thermal capacity store and emit greater heat than vegetation.

Source: www.urban-climate-energy.com

- Results of the study show that **water bodies (ponds, wetlands, streams) and green areas have a significant cooling effect on the micro-climate**, especially at higher ambient air temperatures. Such areas experience an average reduction of 1°C during temperatures higher than 20°C .
- Cooling only occurred during the daytime and ranged from 0.5 to 2.0°C . The cooling effect was found to be greater when temperatures are higher.
- It was also found that the cooling effect did not extend beyond 50 metres from the water body/green area.
- **Cooling was significantly affected by urban form.** Streets which were open to lakes/ponds/rivers, areas with more vegetation, areas with reflective surfaces, led to more effective cooling.
- **City cooling effects can be greatly enhanced by careful consideration of urban design incorporating Sustainable Stormwater Management Systems.**

Green & Blue Areas lower temperatures

Sustainable Urban Drainage System including Green River Corridors can significantly reduce Urban Heat Islands effect & create the possibility for a better quality of life and a lower carbon footprint through River Management.

RESULTS FROM CHEONGGYEcheon RIVER, SEOUL: 2003 AND 2005

Lee Myung-bak, Seoul's mayor

This river was paved-over by elevated highway creating congestion, pollution & Heat in the city. The river was then revived and restored, replacing the highway above it with open space and replanting of a vegetation park which now attracts 64,000 visitors a day. **The area now experiences lower ambient temperatures 3°C lower than city average, land prices have soared and biodiversity increased by 639 % along this new blue-green corridor.**

GREEN, REFLECTIVE SURFACES OF COMPOSITE SWALES REDUCES SOLAR HEAT ABSORPTION

Universiti Sains Malaysia Engineering Campus is built on a Model Bio-Ecological Drainage System

Engineered Channel & Recreational Ponds – Beautiful Landscape & Functional

"Bio-ecological Drainage Systems in Urban Stormwater Management can Effectively Control Urban Heat Island Effect & has many other Advantages"

RWH Systems in Sustainable Urban Drainage System including Green Roofs are Green Building Designs that create the possibility for a better quality of life and a lower carbon footprint through more efficient infrastructure and planning.

Another Example of RWH System – Chulalongkorn Park, Bangkok

Chulalongkorn Park Keeps Bangkok Afloat in Monsoon Season

Bangkok: This Green park can significantly reduce Urban Heat Islands, Store & Regulate Water, Prevent Flooding & Create a better quality of life and a lower carbon footprint to Combat Global Warming.

The park addresses major environmental issues facing Bangkok as a rapidly developed, hard-paved city: **water management** and the **urban heat island effect**. The Increase in Evapotranspiration also increases Upward Heat Transfers, reducing Urban heat Islands.

OTHER METHODS TO REDUCE URBAN HEAT ISLANDS

Urban Farm Pasona HQ Tokyo

5. CONCLUSION

- Research Results show that Rainwater Harvesting & Sustainable Urban Drainage System (SUDS) can be the way forward for addressing urban floods, droughts & heat in cities
- RWH Systems can control Floods - By minimizing the surface runoff at source through the provision of on-site facilities & peak runoff can be reduced in downstream area
- RWH Systems can control Droughts - Stormwater Quality improves to Water Quality Class IIB if Pond Harvesting System is used. Detention Pond water can be used as an emergency water source. Every housing estate will have an emergency water source if each has a detention pond.

Conclusion (cont...)

- RWH Systems can control Heat – Rooftop Rainwater Harvesting incorporating Green Roofs Help Reduce Urban Heat islands Significantly.
- RWH Ponds produce a Green, Productive (Urban Farms) and Healthy Urban Environment, improving Quality of Life and Livability of Cities.
- RWH Ponds/SUDS is a Holistic Tool to Combat Global Warming in terms of Flood, Drought & Heat Alleviation.
- RWH Pond Systems are Aesthetically Pleasing & Safe – Scenic, has Recreational Value and not a Public Hazard (Compared to Open Drains!).
- Considering all the Benefits, RWH Systems should be made Mandatory in building designs.

27 May 2016: Two teenage boys drowned after they slipped and fell into a monsoon drain at Jalan Sungai Panjang in Selangor.
